Weight of basic unit	kg	4,5	9	17	

¹⁾ BW-Fixators® are adjustable up to this load.

²⁾ This is the standard factor for the determination of the BW-Fixator® size.

³⁾ Found by applying a changing load equal to the recommended proportional machine load. The operating range will be covered when the machine has been levelled and bound down with the anchor bolts.

Determination of BW-Fixator® size

The proportional machine load recommended is a function of the net weight of the machine divided by the number of support points (BW-Fixators®).

For machinery with sizable variations in partial weight, it is the heaviest machine load that has to be divided by the number of bearing points and the resulting BW-Fixator® size has to be used everywhere under the machine.

Formula for calculating the Resilience of BW-Fixators® Serie EK

$$\Delta f[\mu\text{m}] = \frac{\Delta F}{c} = \frac{\text{Load change N}}{\text{Spring constant N}/\mu\text{m}}$$

Note:

The total of the forces a - e exerted must not exceed the permissible maximum load

- a) Proportional machine load
- b) Tensile force exerted by anchor bolt
- c) Dynamic forces
- d) Changing loads (moving machine parts or workpieces)
- e) Forces counteracting moments

wes

Anchor bolt for direct connection of the machine to the foundation
